Hi Anna:

Sorry I missed your call. I reviewed your voice mail and accidentally deleted your message but I believe that I did get most of your questions. Lanphar 1-12 was a natural gas producer and is currently hooked into the main production facility by means of a 3 inch steel pipeline. If the permit to inject into the Lanphar 1-12 is approved, natural gas that is produced with the oil from up to two oil producers in the pool (reef structure) will be injected back into the reef structure via Lanphar 1-12 to help maintain the reservoir pressure of the pool for enhanced recovery of the oil reserves. There is a natural gas compressor in the production facility which will facilitate injection of the natural gas into Lanphar 1-12. The existing 3" steel pipeline, as per MDEQ regulations will be pressure tested on an annual basis to confirm the safety of the pipeline.

I will try to call you tomorrow morning but you may be in transit.

Best Regards

Duncan
